Flood record in Twigworth, Gloucestershire

compiled by G.Sharpley
(gdasharpley@gmail.com)
for the SFRA, July 2026

FIG.1 shows the Twigworth Green construction site, Christmas Eve, 2020

FIG.1 (Twigworth Green prior to construction, December 2020)

Since that flood in December 2020, hundreds of houses have been built on this site. This flood is defined as ‘surface water’ or ‘pluvial’ flooding, water that has accumulated after heavy or persistent rain. Twigworth is especially vulnerable to it. The poet Ivor Gurney called these fields Gloucestershire’s ‘water meadows’.

FIG.2 below shows the same site six weeks later after several industrial pumps had been constantly pumping flood water down to the Hatherley Brook.

FIG.2 (Twigworth Green, February 2021)

In FIG.2 you will see a stretch of water in the distance. This is flooding from the River Severn, ‘river flooding’ or ‘fluvial’ flooding. This flood in 2020/1 is nothing like as bad as it was in 2007, when the fluvial water crept closer to the centre of the village. Several properties were flooded. There are two maps below: the fluvial (river) flooding and the surface water (pluvial) map. The fluvial map (FIG.3) is in my opinion quite accurate, and aligns with the 2007 flood. The surface-water map (FIG.4) is less so, because it is much more recent that the Environment Agency has begun to record surface water for mapping.

FIG.3 Fluvial floodmap for Twigworth

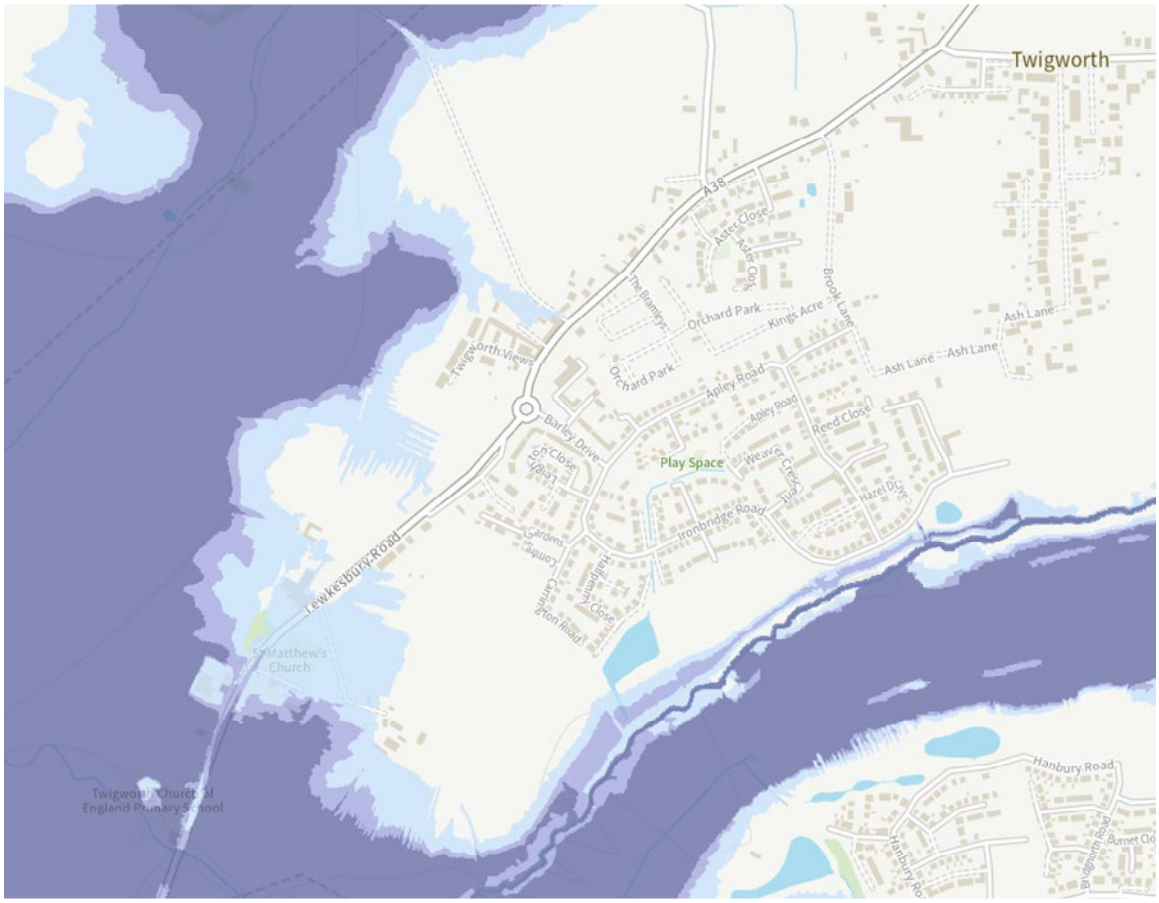

FIG.4 Pluvial (surface-water) floodmap for Twigworth

The pluvial map (Fig.4), though an improvement on previous mapping, is not quite telling the full story for two reasons. The first, already mentioned, is that this form of mapping started only recently. The second is the impact of multiple developments, which are having an ongoing effect on water course and subaquifer displacement. For example, St Matthew's churchyard was not known to flood before 2020 (FIG.5). The pluvial flood picture is steadily worsening.

FIG.5 (St Matthew's Churchyard, December 2020)

For the newly-built houses pluvial floodwater is not such a threat. Twigworth Green (see FIG.1) has been built on a huge amount of imported hard core. The houses have been raised to counter possible flooding in the future. The problem with that, of course, is that the water which would have lain in Ivor Gurney's water meadow for a number of weeks, quietly seeping into the brook, now has to go somewhere else, and so the risks are increased for other dwellings off site. There are attenuation ponds which are intended to manage that risk; but their effectiveness is known to be limited in areas of low gradient. Twigworth Green is not the only site where the ground has been raised.

Fig.6 shows the pre-construction site at Yew Tree Farm, what would become Fallow Fields (75 houses).

FIG.6 Yew Tree Farm (construction site for Fallow Fields, Twigworth, February 2021)

In September 2020 Tewkesbury Borough Council approved the developer's plans for sustainable surface-water drainage. A few weeks later it was flooded (with surface water). This picture was taken five weeks after the water started to recede. Construction was delayed for approximately three months.

Here too the houses are built raised up on imported hardcore. Again there is concern among others in the vicinity as to what may happen when we experience another intense storm.

The same applies to the houses at Athelai Edge at the A38/Down Hatherley Lane junction (FIG.7).

FIG.7 (construction site for Athelai Edge, December 2020)

The village is now lined up for several other major sites, at different stages of the planning process, and equally vulnerable to surface-water (pluvial) flooding.

There is no question that the scale of development has had an ongoing impact on flood risk to others.

Most of the evidence here is various flooded areas which have now been built on. I have not shown private dwellings, out of respect to the residents who may not want the vulnerability of their homes made public. It is a harrowing experience to be flooded.

Over the past few years several people's gardens, outbuildings and drives have been flooded, and a handful of houses have been flooded too. However, since the building programme started in 2020 we have not been fully tested. The three months leading up to the 2020/1 flood saw a total rainfall of 354mm. The three months before the flooding in 2007 experienced 434mm. (See Appendix B)

There has not been a sequence of three months with over 350mm of rainfall since. October-December 2023 had a total of 323.6mm, and the *four* months Nov 2025 – Feb 2026 experienced 442mm. Otherwise no sequence of three months has reached 300mm since the major building works began. However,

people still report a worsening of surface water, in Twigworth and in adjoining villages, and that it happens more frequently, and rises more quickly.

This map (FIG.8) is a combination of the river flood map and the surface-water map.

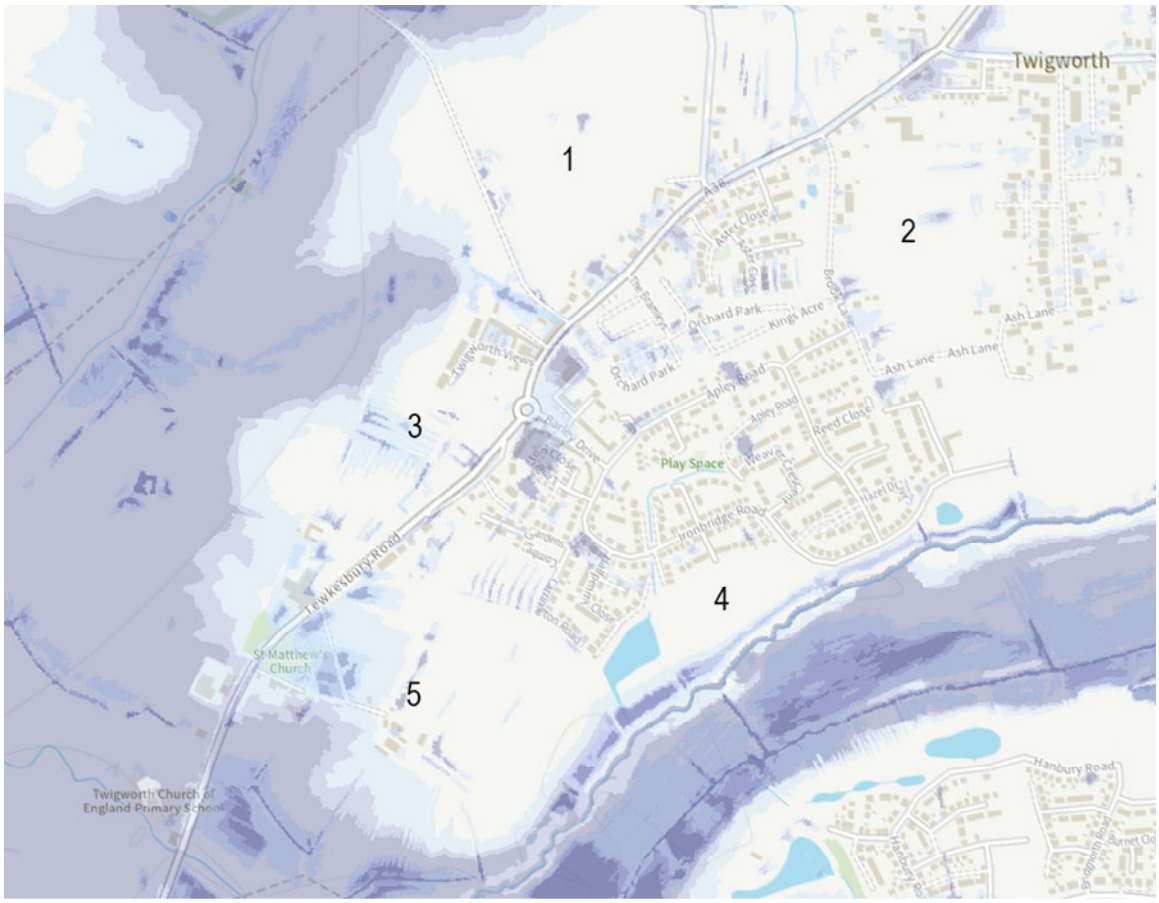

FIG.8 Surface-water flood map laid over the river flood map

As you will see, the clean white spaces are few and far between. There is currently an application for 170 houses to be built in the field [1]. The field between Brook Lane and Ash Lane [2] is at an advanced stage of the planning process with 160 houses designated for this area.

The field [3] is under application for 100 houses. Flood Zone 3 (highest risk) comes on to the site in the top left corner. Elsewhere the site is subject to Flood Zone 2 and surface water flooding. Given that there is no significant sloping or gradient between the site and Flood Zone 3 close by, the neutral observer can only conclude that climate change and worsening conditions are piling up problems for the future.

[4] is set apart as a sports field.

[5] is about the only open space in the village not yet to be designated for development. This land is subject to increasing surface-water flooding and vulnerable to river flooding from the Hatherley Brook to the south and from the Severn overflow.

The farmer at Church Farm [5] says surface-water flooding has worsened since the adjoining development started at Twigworth Green, and that the river flooding is more frequent, and that when it happens, the water rises more quickly. His remarks are recorded in Appendix A.

One of the expressed purposes of the SFRA is to “safeguard land that may be needed for flood risk management measures, such as flood storage areas or flood defences”.

Caught between the fluvial river flooding and pluvial surface water, and with precious little gradient in between, Twigworth is fast running out of potential land to be able to do this.

George Sharpley
Twigworth
July 2026

About the contributor:
I have been observing flood events in this area since October 2000, working in partnership with other locals and with a senior hydrologist, Prof. Ian Cluckie. I live in Twigworth, and am currently chair of Twigworth Parish Council.

APPENDIX A

Increase in flooding at Church Farm Twigworth

Jim Watkins has farmed Church Farm in Twigworth, Gloucester, GL2 9PG, since 1980:

"The farm is vulnerable to most types of flood: from the River Severn, the Hatherley Brook, and surface-water flooding. It now happens more often, and quicker. Every year now there are days when I have to move stock, or they are cut off by flooding from the rivers.

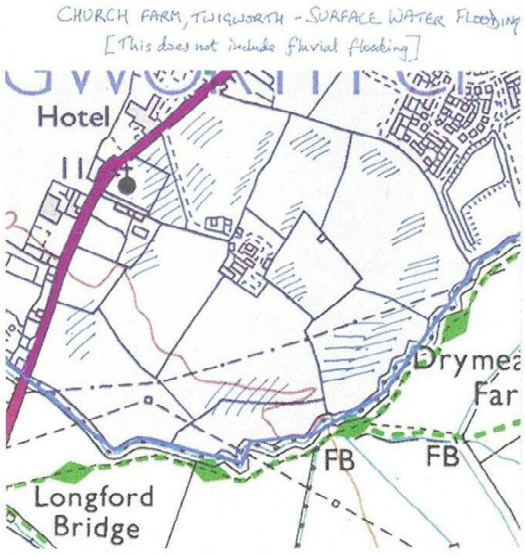

I've noticed that more recently the flood water appears first on this side of the brook. Before, there used to be more of it on the other side, on Sivell's side towards Longford.

There has been surface-water flooding on both sides of the drive-way and down to the church and the meadow between the church and the farmhouse. There's more south and south east towards the brook, where it meets the flooding from the river.

Flooding has always been bad in the fields along the brook (Hatherley Brook). That has got worse over the past few years.

There is now an increase in the ponds and large puddles in the fields that border the new houses (Twigworth Green). The problem has got worse since they were built. The water has got to go somewhere. If it can't go down the brook (because it is already flooded), it comes this way, it comes on to our fields.

When there is a lot of rain, there aren't many areas on the farm that are free from the ponds, and there are large puddles everywhere."

APPENDIX B

Rainfall figures
collated by George Hedley

Notes:

1. The rainfall gauge is at Over, about 3½ miles south west of Twigworth.
2. Rainfall figures contribute to local pluvial flooding (and fluvial flooding downstream). Fluvial flooding is principally caused by rainfall at a river's and its tributaries' sources.
3. The data is from 2020 to current (July 2026). For comparison, 2007 is also included.
